ask in the forums

I have a LITE-ON LTR 32123S and it is capable of bruning at 32x, and it has been bruning at 32x for about 3 years, but recently, it started messing up in Nero, i would click brune at 32x and it would start to brune at 12x and gat 1/2 way through and then the the brune would fail, i thouth it was Nero, so i got Brrrrrrune and it did the exact same thing, i would click 32x, then it would start at 12x and fail, Winamp does the exact same,... when a pressed brune at 8x it would work but this is to slow for me,... does anyone know how this can be fixed? any help would be greatly appreciated

Are you using TAO mode to brune? This sometimes helps me when the bruning is messing up. Apart from that, it looks like your drive is getting old and you need to purchase a new bruner if you want to brune at faster than 8x.

maybe the CD-Rs you're trying to brune are not made to be bruned that fast. If you try to brune them too fast, the software will usually slow the brune speed down to the maximum that the media supports. As far as why the brune is failing, it could just be cheap quality media. Make sure you're bruning only good quality CD-Rs. My favorites are Taiyo Yuden and Verbatim.

Well, then maybe your bruner has bruned its last disc. Sounds like its time for a new bruner

Good Luck!

I have been looking for a new CD bruner now for about a month. 😞

I even checked NewEgg , Amazon & Ebay

optical drives fail, especially bruners. 3 years is a good run 😊

I don't even use my cdrw to brune any more. It's new but my dvdwr seems to work better, especially with eac rips. Some install discs are not even read by my cdrw but work fine with my dvdwr. ?? I think all one needs are 2 Plextor sata dvd bruners

To hell with cd drives

Try opening my computer before inserting a blank cd-r.
might sound stupid but I had it when directly bruning from nero my speed wouldn` t go faster than 8x.
after starting the proces with my computer and wait till the cd` r was loaded and than start nero the problem was gone.
This problem started after I installed EAC.
Don` t ask me why

I would recommend against bruning at full speed. It's more prone to errors that way. It's not an issue anyways unless you're bruning like 500 CDs

To hell with cd drives

we live in similar worlds. However, some like the cheaper models...

Trapstar, are you bruning mp3 to audio cd? anything 'on the fly' can choke your PC and cause errors
additionally, try bruning an image file of your project in nero, then brun the resulting image
